Also, if you're going to send in your info, a little popular web site like.Q: What's a good way to get the values of a lot of variables with minimal code? I'm making a board game. There are N numbers of numbers of items on the board that the players can have. It would be neat to give the players a list of the numbers of each item on the board, so they can see what they have and what they need to complete the game. The number of items on the board ranges from 2-7. What's the best way to do it? Is it worth saving lots of variables in a dictionary, storing them all as strings, then passing a list of strings to each player? What should I use? A: I'd use a.txt file. Just have a file: item1_number item2_number ... itemn_number Then have a function to load the file into a Dictionary. ie: Dictionary itemAmounts(string filename) { Dictionary counts = new Dictionary(); string input = File.ReadLines(filename).FirstOrDefault(x => !string.IsNullOrEmpty(x)).Trim().Split(' ').Skip(1).Select(x => x.Trim()).ToArray(); foreach(string item in input) { counts.Add(item, int.Parse(item)); } return counts; } Also, just save your inputs into your file. I would do something like this: void RunGame() { Dictionary itemAmounts = itemAmounts(string filename); //Rest of your code that deals with itemAmounts here } Q: POST request with two arrays
