Fuel cells are often employed as an electrical power source. A fuel cell is generally an electrochemical device that operates with a fuel such as hydrogen and an oxidant such as oxygen to produce electricity, water, heat and other products. For example, fuel cells may be used in the power generation section of a fuel cell stack for vehicles such as, for example, fuel cell vehicles including a fuel cell stack for a vehicle drive motor. The power generation section (i.e., the section that generates power) of the fuel cell stack generally includes a flow plate or separator, a membrane electrode assembly (MEA), an electrolyte (e.g., a proton exchange membrane (PEM) or solid polymer electrolyte), and gas diffusion media (GDM). The proton exchange membrane is, in some cases, an organic polymer membrane. By itself, however, the proton exchange membrane is not ionically conducting and/or does not conduct protons. In order to operate the fuel cell stack, the proton exchange membrane requires a liquid electrolyte which is typically in contact with the
